Attorney Docket: 03-0773/2868P Page 3 of 13

Amendments to the Claims:

This listing of claims will replace all prior version, and listings, of claims in the application.

Listing of Claims:

- 1 (Currently Amended) A method for providing data integration and exchange between a plurality of client applications over a network, wherein each of the client applications access a respective data source, and wherein the data sources of each of the client applications may be stored in different formats and not directly accessible by the other client applications, the method comprising:
 - (a) providing an adapter API at each of native to—the client applications that provides a first set of methods for the client applications to use to translate data in the respective data sources into XML format; and
 - (b) modifying each of the client applications to invoke the first set of methods in the adapter API to convert the data in the respective data sources into XML format according to a registered schema definition and a document type definition (DTD), to save the XML formatted data in XML files, and to have the XML formatted data in the XML files imported into a database on a server, thereby standardizing the data from the data sources.
- 2 (Previously Presented) The method of claim 1 further including step of:
- (c) including a second set of methods in the adapter API for the client applications that provides consumption logic and methods for automatically exporting data defined in a Web-based schema registry, from the database into the client applications using Web services.

Attorney Docket: 03-0773/2868P

3 (Currently Amended) The method of claim 2 further including the step of: registering the

respective data sources with a schema registry in order to create a-the schema definition

and a the document type definition (DTD).

4 (Canceled).

5 (Canceled).

6 (Currently Amended) The method of claim 3 wherein the adapter API includes an XML

API comprising the first set of methods and a second set of methods, wherein the first set

of methods comprises a Writer API, and the second set of methods comprises a Reader

API.

7 (Currently Amended) The method of claim 6 wherein the client applications are

modified with generator logic that makes calls to methods comprising the adapter API.

wherein once called, the Writer API converts data into XML format in memory and saves

the XML format data in an-the XML files, which is then transported to the server.

8 (Canceled).

9 (Previously Presented) The method of claim 7 wherein the adapter further includes

verification code that verifies the generated XML data against the DTD defined in schema

registry.

10 (Canceled).

11 (Original) The method of claim 7 wherein the server includes an import repository for

receiving the XML files generated by the client applications.

Attorney Docket: 03-0773/2868P

12 (Original) The method of claim 11 wherein the server includes an XML loader that parses each of the XML files in the import repository and stores name/value pairs in the database according to a data hierarchy of the corresponding data source.

- 13 (Currently Amended) A computer-readable medium containing program instructions for providing data integration and exchange between a plurality of client applications over a network, wherein each of the client applications access a respective data source, and wherein the data sources of each of the client applications may be stored in different formats and not directly accessible by the other client applications, the program instructions for:
 - (a) providing an adapter API at each of native to—the client applications that provides a first set of methods for the client applications to use to translate data in the respective data sources into XML format; and
 - (b) modifying each of the client applications to invoke the first set of methods in the adapter API to convert the data in the respective data sources into XML format according to a registered schema definition and a document type definition (DTD), to save the XML formatted data in XML files, and to have the XML formatted data in the XML files imported into a database on a server, thereby standardizing the data from the data sources.

14 (Previously Presented) The computer-readable medium of claim 13 further including instruction of:

(c) including a second set of methods in the adapter API for the client applications that provides consumption logic and methods for automatically exporting data defined in a Web-based schema registry, from the database into the client applications using Web services.

Attorney Docket: 03-0773/2868P Page 6 of 13

15 (Currently Amended) The computer-readable medium of claim 14 further including the

instruction of: registering the respective data sources with a schema registry in order to

create a-the schema definition and a-the document type definition (DTD).

16 (Canceled).

17 (Canceled).

18 (Currently Amended) The computer-readable medium of claim 15 wherein the adapter

API includes an XML API comprising the first set of methods and a second set of methods,

wherein the first set of methods comprises a Writer API, and the second set of methods

comprises a Reader API.

19 (Currently Amended) The computer-readable medium of claim 18 wherein the client

applications are modified with generator logic that makes calls to methods comprising the

adapter API, wherein once called, the Writer API converts data into XML format in memory

and saves the XML format data in anthe XML files, which is transported to the server.

20 (Canceled).

21 (Previously Presented) The computer-readable medium of claim 19 wherein the

adapter further includes verification code that verifies the generated XML data against the

DTD defined in schema registry.

22 (Canceled).

23 (Original) The computer-readable medium of claim 19 wherein the server includes an

import repository for receiving the XML files generated by the client applications.

Attorney Docket: 03-0773/2868P Page 7 of 13

24 (Original) The computer-readable medium of claim 23 wherein the server includes an XML loader that parses each of the XML files in the import repository and stores name/value pairs in the database according to a data hierarchy of the corresponding data source.

25 (Currently Amended) A data integration system comprising:

a network;

a server coupled to the network, the server including a schema registry, a database, and a published adapter API at each of native to the client applications that provides a first set of methods for translating data in respective data sources into XML format; and a plurality of client applications coupled to the network and in communication with the server, wherein each of the client applications access the respective data sources, and wherein the data sources of each of the client applications may be stored in different formats and are not directly accessible by the other client applications, and wherein at least a portion of the client applications includes a corresponding schema definition and document type definition (DTD) registered with the schema registry. and the portion of the client applications includes generation logic for making calls to the first set of methods in the adapter API, such that data in the respective data sources are converted into XML format according to the corresponding schema definition and DTD, wherein the XML formatted data is stored in XML files, wherein the XML formatted data in the XML files is and transferred to the server for storage in a database, wherein the XML formatted XML data in the XML files is verified against the corresponding DTD prior to storage in the database, thereby standardizing the data from the data sources.

Attorney Docket: 03-0773/2868P

26 (Previously Presented) The system of claim 25 wherein the adapter API further includes

a second set of methods for the client applications that that provides consumption logic

and methods for automatically exporting data defined in the schema registry, from the

database into the client applications using Web services.

27 (Currently Amended) The system of claim 26 wherein the adapter API includes an XML

API comprising the first set of methods and the second set of methods, wherein the first

set of methods comprises a Writer API and the second set of methods comprises a Reader

API.

28 (Original) The system of claim 27 wherein the server further includes a schema

generator for generating the schema definition, a DTD generator for generating the DTD.

and an adapter software kit that is downloaded from the server and used to incorporate the

adapter API into the client applications.

29 (Currently Amended) The system of claim 28 wherein the server further includes an

import repository for receiving $\underline{\text{the}}\textsc{XML}$ files generated by the client applications.

30 (Original) The system of claim 29 wherein the server includes an XML loader that

parses each of the XML files in the import repository and stores name/value pairs in the

database according to a data hierarchy of the corresponding data source.
